Document Title

256Kx36 & 512Kx18 Bit Synchronous Pipelined Burst SRAM

Revision History

Rev. No.	History	Draft Date	Remark
0.0	Initial Draft	Aug. 2011	Preliminary
1.0	1. Final Spec Release 2. Insert ICC Parameters	Nov. 2011	Final
1.1	Add 1.8V V _{DD} operation	Feb. 2017	Final

256Kx36 & 512Kx18 Bit Synchronous Pipelined Burst SRAM

Features

- $V_{DD} = 1.8V (1.7V \sim 2.0V)$ or $2.5V(2.3V \sim 2.7V)$ or $3.3V(3.1V \sim 3.5V)$ Power Supply
- $V_{DDQ} = 1.7V \sim 2.0V$ I/O Power Supply ($V_{DD}=1.8V$) or $2.3V \sim 2.7V$ I/O Power Supply ($V_{DD}=2.5V$) or $2.3V \sim 3.5V$ I/O Power Supply ($V_{DD}=3.3V$)
- Synchronous Operation
- 2 Stage Pipelined operation with 4 Burst
- On-Chip Address Counter
- Self-Timed Write Cycle
- On-Chip Address and Control Registers
- Byte Writable Function
- Global Write Enable Controls a full bus-width write
- Power Down State via ZZ Signal
- \overline{LBO} Pin allows a choice of either a interleaved burst or a linear burst
- Three Chip Enables for simple depth expansion with No Data Contention only for TQFP ; 2cycle Enable, 1cycle Disable
- Asynchronous Output Enable Control
- ADSP, ADSC, ADV Burst Control Pins
- TTL-Level Three-State Output
- Operating in commercial and industrial temperature range
- 100-TQFP-1420A (Lead free package)

General Description

The S7A803630M and S7A801830M are 9,437,184-bit Synchronous Static Random Access Memory designed for high performance.

It is organized as 256K(512K) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance applications; \overline{GW} , \overline{BW} , \overline{LBO} , ZZ. Write cycles are internally self-timed and synchronous.

Full bus-width write is done by \overline{GW} , and each byte write is performed by the combination of \overline{WEx} and \overline{BW} when \overline{GW} is high. And with \overline{CS}_1 high, \overline{ADSP} is blocked to control signals.

Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(\overline{ADV}) input.

\overline{LBO} pin is DC operated and determines burst sequence(linear or interleaved).

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The S7A803630M and S7A801830M are fabricated using high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

Key Parameters

Parameter	Symbol	$V_{DD}=2.5V$ or $3.3V$	$V_{DD}=1.8V$	Unit
Cycle Time	tCYC	4.0	4.0	ns
Clock Access Time	tCD	2.6	3.0	ns
Output Enable Access Time	tOE	2.6	3.0	ns
Operating Current	I _{cc}	160	160	mA
Standby Current	I _{Sb2}	30	30	mA

9Mb Synchronous Pipelined Burst SRAM Ordering Information

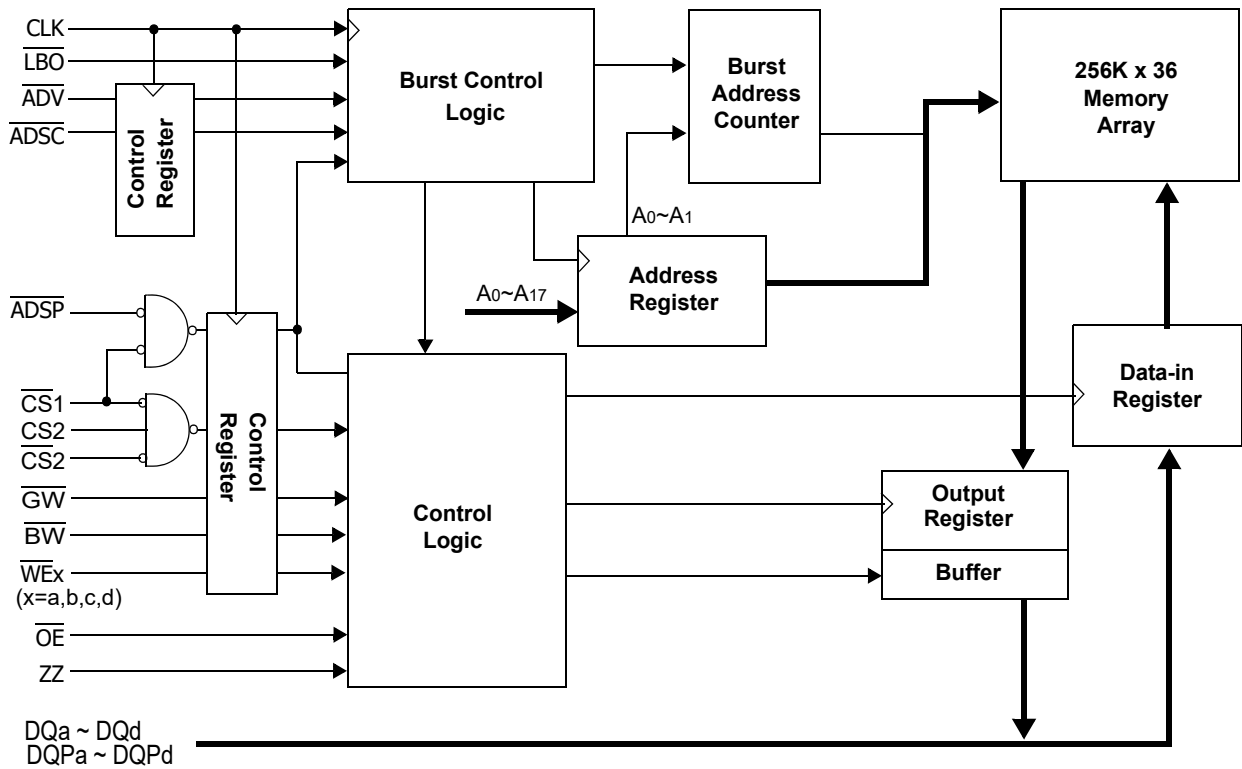

Org.	V_{DD} (V)	Speed (ns)	Access Time (ns)	Part Number	RoHS Avail.
512Kx18	1.8	4.0	3.0	S7A801830M-PC(I)25	0
	3.3/2.5	4.0	2.6	S7A801830M-PC(I)25	0
256Kx36	1.8	4.0	3.0	S7A803630M-PC(I)25	0
	3.3/2.5	4.0	2.6	S7A803630M-PC(I)25	0

Function Description

The S7A803630M and S7A801830M are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of \overline{OE} , \overline{LBO} and \overline{ZZ}) are sampled on rising clock edges. The start and duration of the burst access is controlled by \overline{ADSC} , \overline{ADSP} and \overline{ADV} and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with \overline{ADV} . When \overline{ZZ} is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When \overline{ZZ} returns to low, the SRAM normally operates after 2cycles of wake up time. \overline{ZZ} pin is pulled down internally.

Read cycles are initiated with \overline{ADSP} (regardless of \overline{WEx} and \overline{ADSC})using the new external address clocked into the on-chip address register whenever \overline{ADSP} is sampled low, the chip selects are sampled active, and the output buffer is enabled with \overline{OE} . In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of \overline{CLK} , are carried to the Data-out buffer by the next positive edge of \overline{CLK} . The data, registered in the Data-out buffer, are projected to the output pins. \overline{ADV} is ignored on the clock edge that samples \overline{ADSP} asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when \overline{WEx} are sampled High and \overline{ADV} is sampled low. And \overline{ADSP} is blocked to control signals by disabling $\overline{CS1}$.

All byte write is done by \overline{GW} (regardless of \overline{BW} and \overline{WEx}), and each byte write is performed by the combination of \overline{BW} and \overline{WEx} when \overline{GW} is high.

Write cycles are performed by disabling the output buffers with \overline{OE} and asserting \overline{WEx} . \overline{WEx} are ignored on the clock edge that samples \overline{ADSP} low, but are sampled on the subsequent clock edges. The output buffers are disabled when \overline{WEx} are sampled Low(regardless of \overline{OE}). Data is clocked into the data input register when \overline{WEx} sampled Low. The address increases internally to the next address of burst, if both \overline{WEx} and \overline{ADV} are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals(\overline{WEa} , \overline{WEb} , \overline{WEc} or \overline{WEd}) sampled low. The \overline{WEa} control \overline{DQa} and \overline{DQPa} , \overline{WEb} controls \overline{DQb} and \overline{DQPb} , \overline{WEc} controls \overline{DQc} and $\overline{DQ Pc}$, and \overline{WEd} control \overline{DQd} and $\overline{DQ Pd}$. Read or write cycle may also be initiated with \overline{ADSC} , instead of \overline{ADSP} . The differences between cycles initiated with \overline{ADSC} and \overline{ADSP} as are follows;

- \overline{ADSP} must be sampled high when \overline{ADSC} is sampled low to initiate a cycle with \overline{ADSC} .
- \overline{WEx} are sampled on the same clock edge that sampled \overline{ADSC} low(and \overline{ADSP} high).

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the \overline{LBO} pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

Burst Sequence Table

(Interleaved Burst, \overline{LBO} =High)

\overline{LBO} PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

(Linear Burst, \overline{LBO} =Low)

\overline{LBO} PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

Note : 1. \overline{LBO} pin must be tied to High or Low, and Floating State must not be allowed.

Asynchronous Truth Table

Operation	\overline{ZZ}	\overline{OE}	I/O STATUS
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes

1. X means "Don't Care".
2. \overline{ZZ} pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with \overline{OE} , otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

Truth Tables

Synchronous Truth Table

\overline{CS}_1	CS_2	\overline{CS}_2	\overline{ADSP}	\overline{ADSC}	\overline{ADV}	\overline{Write}	CLK	Address Accessed	Operation

Notes : 1. X means "Don't Care".

2. All inputs in this table must meet setup and hold time around the rising edge of CLK(↑).

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Voltage on V _{DD} Supply Relative to V _{SS}	V _{DD}	-0.3 to 4.6	V
Voltage on V _{DDQ} Supply Relative to V _{SS}	V _{DDQ}	V _{DD}	V
Voltage on Input Pin Relative to V _{SS}	V _{IN}	-0.3 to V _{DD} +0.3	V
Voltage on I/O Pin Relative to V _{SS}	V _{IO}	-0.3 to V _{DDQ} +0.3	V
Power Dissipation	P _D	1.6	W
Storage Temperature	T _{STG}	-65 to 150	°C
Operating Temperature	Commercial	T _{OPR}	0 to 70
	Industrial	T _{OPR}	-40 to 85
Storage Temperature Range Under Bias	T _{BIAS}	-10 to 85	°C

Notes : Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Operating Conditions

Parameter	Symbol	Min	Typ.	Max	Unit
Supply Voltage	V _{DD1}	1.7	1.8	2.0	V
	V _{DDQ1}	1.7	1.8	2.0	V
	V _{DD2}	2.3	2.5	2.7	V
	V _{DDQ2}	2.3	2.5	2.7	V
	V _{DD3}	3.1	3.3	3.5	V
	V _{DDQ3}	2.3	3.3	3.5	V
Ground	V _{SS}	0	0	0	V

Notes: 1. The above parameters are also guaranteed at industrial temperature range.
 2. It should be $V_{DDQ} \leq V_{DD}$

Capacitance(T_A=25°C, f=1MHz)

Parameter	Symbol	Test Condition	Min	Max	Unit
Input Capacitance	C _{IN}	V _{IN} =0V	-	5	pF
Output Capacitance	C _{OUT}	V _{OUT} =0V	-	7	pF

Note : Sampled not 100% tested.

Overshoot Timing

Undershoot Timing

DC Electrical Characteristics

ZZ High to Power Down	t _{PDS}	2	-	2	-	cycle
ZZ Low to Power Up	t _{PUS}	2	-	2	-	cycle

- Notes :**
1. The above parameters are also guaranteed at industrial temperature range.
 2. All address inputs must meet the specified setup and hold times for all rising clock edges whenever \overline{ADSC} and/or \overline{ADSP} is sampled low and \overline{CS} is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 3. Both chip selects must be active whenever \overline{ADSC} or \overline{ADSP} is sampled low in order for the this device to remain enabled.
 4. \overline{ADSC} or \overline{ADSP} must not be asserted for at least 2 Clock after leaving ZZ state.

Sleep Mode

Sleep Mode is a low current, power-down mode in which the device is deselected and current is reduced to I_{SB2} . The duration of Sleep Mode is dictated by the length of time the ZZ is in a High state.

After entering Sleep Mode, all inputs except ZZ become disabled and all outputs go to High-Z.

The ZZ pin is an asynchronous, active high input that causes the device to enter Sleep Mode.

When the ZZ pin becomes a logic High, I_{SB2} is guaranteed after the time t_{ZZI} is met. Any operation pending when entering Sleep Mode is not guaranteed to successful complete. Therefore, Sleep Mode (Read or Write) must not be initiated until valid pending operations are completed. Similarly, when exiting Sleep Mode during t_{PUS} , only a Deselect or Read cycle should be given while the SRAM is transitioning out of Sleep Mode.

Sleep Mode Electrical Characteristics

Description	Condition	Symbol	Min	Max	Unit
Current during SLEEP MODE	$ZZ \geq V_{IH}$	I_{SB2}		30	mA
ZZ active to input ignored		t_{PDS}	2		cycle
ZZ inactive to input sampled		t_{PUS}	2		cycle
ZZ active to SLEEP current		t_{ZZI}		2	cycle
ZZ inactive to exit SLEEP current		t_{RZZI}	0

Application Information

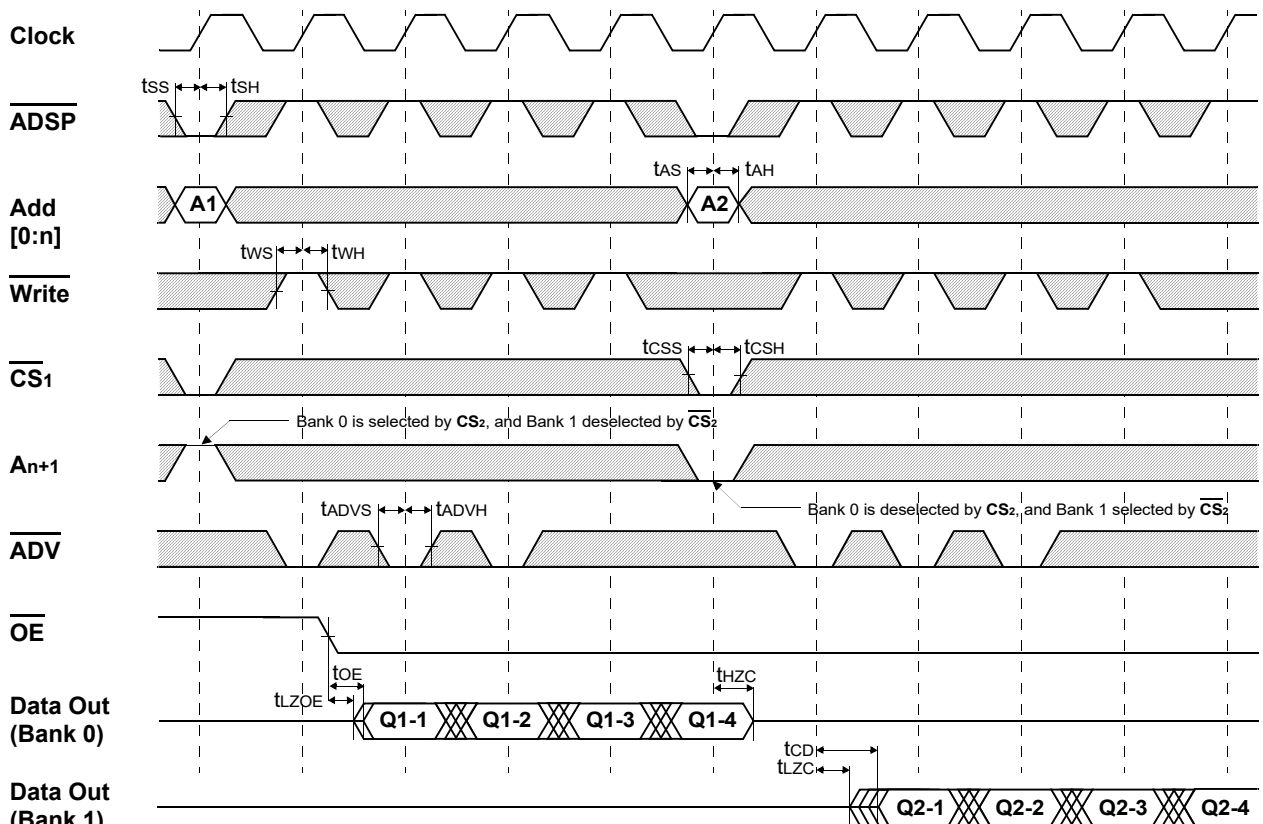

Depth Expansion

The Netsol 256Kx36 Synchronous Pipelined Burst SRAM has two additional chip selects for simple depth expansion. This permits easy secondary cache upgrades from 256K depth to 512K depth without extra logic.

Interleave Read Timing (Refer to non-interleave write timing for interleave write timing)

(ADSP Controlled, ADSC=High)

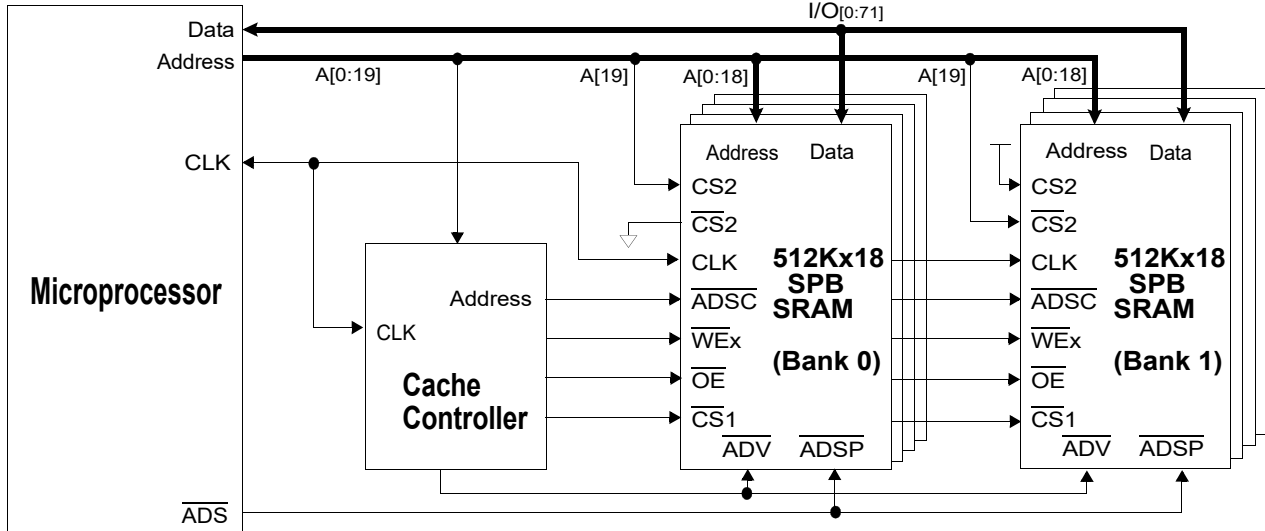

*Notes : n = 14 32K depth, 15 64K depth
16 128K depth, 17 256K depth
18 512K depth

□ Don't Care ⊗ Undefined

Application Information

Depth Expansion

The Netsol 512Kx18 Synchronous Pipelined Burst SRAM has two additional chip selects for simple depth expansion. This permits easy secondary cache upgrades from 512K depth to 1M depth without extra logic.

Interleave Read Timing (Refer to non-interleave write timing for interleave write timing)

(ADSP Controlled, ADSC=High)

*Notes : n = 14 32K depth, 15 64K depth
 16 128K depth, 17 256K depth
