1Mx36 & 2Mx18 Flow-Trough SRAM

1Mx36 & 2Mx18 Bit Flow-Trough SRAM

Features

- $V_{DD} = 1.8V$ (1.7V ~ 2.0V) or 2.5V (2.3V ~ 2.7V) or 3.3V (3.1V ~ 3.5V) Power Supply
- $V_{DDQ} = 1.7V \sim 2.0V$ I/O Power Supply ($V_{DD}=1.8V$) or 2.3V ~ 2.7V I/O Power Supply ($V_{DD}=2.5V$) or 2.3V ~ 3.5V I/O Power Supply ($V_{DD}=3.3V$)
- Synchronous Operation
- Self-Timed Write Cycle
- On-Chip Address Counter and Control Registers
- Byte Writable Function
- Global Write Enable Controls a full bus-width write
- Power Down State via ZZ Signal
- LBO Pin allows a choice of either a interleaved burst or a linear burst
- Three Chip Enables for simple depth expansion with No Data Contention only for TQFP
- Asynchronous Output Enable Control
- ADSP, ADSC, ADV Burst Control Pins
- TTL-Level Three-State Output
- Operating in commercial and industrial temperature range
- 100-TQFP-1420A (Lead free package)
- 165FBGA(11x15 ball array) with body size of 13mmx15mm. (Lead free package)

General Description

The S7B323635M and S7B321835M are 37,748,736-bit Synchronous Static Random Access Memory designed for high performance.

It is organized as 1M(2M) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance applications; \overline{GW} , \overline{BW} , LBO, ZZ. Write cycles are internally self-timed and synchronous.

Full bus-width write is done by \overline{GW} , and each byte write is performed by the combination of \overline{WEx} and \overline{BW} when \overline{GW} is high. And with \overline{CS}_1 high, \overline{ADSP} is blocked to control signals.

Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(\overline{ADV}) input.

\overline{LBO} pin is DC operated and determines burst sequence(linear or interleaved).

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The S7B323635M and S7B321835M are fabricated using high performance CMOS technology and is available in a 100pin TQFP package and 165FBGA package. Multiple power and ground pins are utilized to minimize ground bounce.

Key Parameters

Parameter	Symbol	-65	-75	Unit
Cycle Time	tCYC	7.5	8.5	ns
Clock Access Time	tCD	6.5	7.5	ns
Output Enable Access Time	tOE	3.5	3.5	ns
Operating Current	I _{CC}	235	225	mA
Standby Current	I _{SB2}	120	120	mA

36Mb Flow-Through SRAM Ordering Information

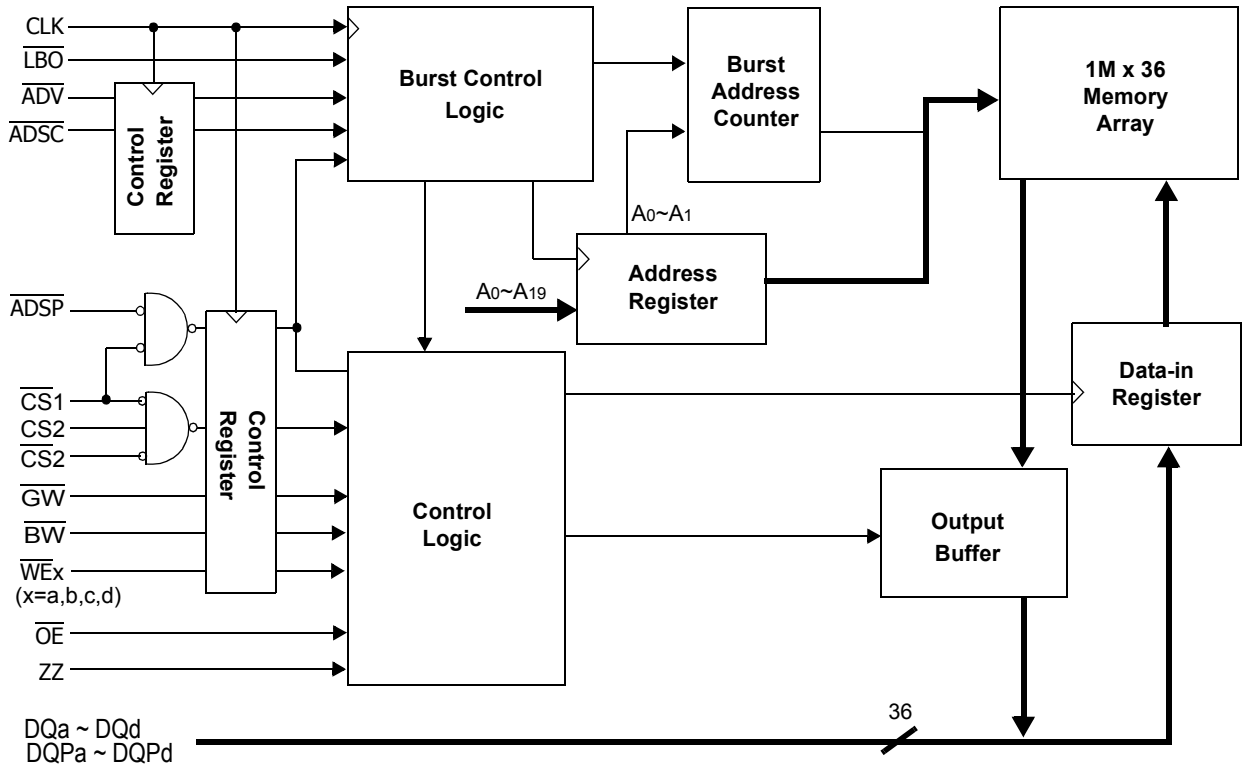

Org.	VDD (V)	Speed (ns)	Access Time (ns)	Part Number	RoHS Avail.
2Mx18	1.8/3.3/2.5	7.5	6.5	S7B321835M-P(E)C(I)65	0
	1.8/3.3/2.5	8.5	7.5	S7B321835M-P(E)C(I)75	0
1Mx36	1.8/3.3/2.5	7.5	6.5	S7B323635M-P(E)C(I)65	0
	1.8/3.3/2.5	8.5	7.5	S7B323635M-P(E)C(I)75	0

- Note 1. P(E) [Package type] : P - 100TQFP Pb Free, E - 165FBGA Pb Free
2. C(I) [Operating Temperature] : C-Commercial, I-Industrial

Function Description

The S7B323635M and S7B321835M are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of \overline{OE} , \overline{LBO} and \overline{ZZ}) are sampled on rising clock edges. The start and duration of the burst access is controlled by \overline{ADSC} , \overline{ADSP} and \overline{ADV} and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with \overline{ADV} .

When \overline{ZZ} is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When \overline{ZZ} returns to low, the SRAM normally operates after 2cycles of wake up time. \overline{ZZ} pin is pulled down internally.

Read cycles are initiated with \overline{ADSP} (or \overline{ADSC}) using the new external address clocked into the on-chip address register when both \overline{GW} and \overline{BW} are high or when \overline{BW} is low and \overline{WEa} , \overline{WEb} , \overline{WEc} , and \overline{WEd} are high. When \overline{ADSP} is sampled low, the chip selects are sampled active, and the output buffer is enabled with \overline{OE} . the data of cell array accessed by the current address are projected to the output pins.

Write cycles are also initiated with \overline{ADSP} (or \overline{ADSC}) and are differentiated into two kinds of operations; All byte write operation and individual byte write operation.

All byte write occurs by enabling \overline{GW} (independent of \overline{BW} and \overline{WEx}), and individual byte write is performed only when \overline{GW} is high and \overline{BW} is low. In S7B323635M, a 1Mx36 organization, \overline{WEa} controls \overline{DQa} and \overline{DQPa} , \overline{WEb} controls \overline{DQb} and \overline{DQPb} , \overline{WEc} controls \overline{DQc} and \overline{DQPc} and \overline{WEd} controls \overline{DQd} and \overline{DQPd} .

$\overline{CS1}$ is used to enable the device and conditions internal use of \overline{ADSP} and is sampled only when a new external address is loaded.

\overline{ADV} is ignored at the clock edge when \overline{ADSP} is asserted, but can be sampled on the subsequent clock edges. The address increases internally for the next access of the burst when \overline{ADV} is sampled low.

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the \overline{LBO} pin. When this pin is Low, linear burst sequence is selected. And this pin is High, Interleaved burst sequence is selected.

Burst Sequence Table

(Interleaved Burst, \overline{LBO} =High)

\overline{LBO} PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

(Linear Burst, \overline{LBO} =Low)

\overline{LBO} PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

Note : 1. \overline{LBO} pin must be tied to High or Low, and Floating State must not be allowed.

Asynchronous Truth Table

Operation	\overline{ZZ}	\overline{OE}	I/O STATUS
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes

1. X means "Don't Care".
2. \overline{ZZ} pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with \overline{OE} , otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

Truth Tables

Synchronous Truth Table

\overline{CS}_1	CS_2	\overline{CS}_2	\overline{ADSP}	\overline{ADSC}	\overline{ADV}	\overline{Write}	CLK	Address Accessed	Operation

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit	
Voltage on V _{DD} Supply Relative to V _{SS}	V _{DD}	-0.3 to 4.6	V	
Voltage on V _{DDQ} Supply Relative to V _{SS}	V _{DDQ}	V _{DD}	V	
Voltage on Input Pin Relative to V _{SS}	V _{IN}	-0.3 to V _{DD} +0.3	V	
Voltage on I/O Pin Relative to V _{SS}	V _{IO}	-0.3 to V _{DDQ} +0.3	V	
Power Dissipation	P _D	1.6	W	
Storage Temperature	T _{STG}	-65 to 150	°C	
Operating Temperature	Commercial	T _{OPR}	0 to 70	°C
	Industrial	T _{OPR}	-40 to 85	°C
Storage Temperature Range Under Bias	T _{BIAS}	-10 to 85	°C	

Notes : Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Operating Conditions

Parameter	Symbol	Min	Typ.	Max	Unit
Supply Voltage	V _{DD1}	1.7	1.8	2.0	V
	V _{DDQ1}	1.7	1.8	2.0	V
	V _{DD2}	2.3	2.5	2.7	V
	V _{DDQ2}	1.7	2.5	2.7	V
	V _{DD3}	3.1	3.3	3.5	V
	V _{DDQ3}	2.3	3.3	3.5	V
Ground	V _{SS}	0	0	0	V

Notes: 1. The above parameters are also guaranteed at industrial temperature range.
2. It should be $V_{DDQ} \leq V_{DD}$

Capacitance (T_A=25°C, f=1MHz)

Parameter	Symbol	Test Condition	Min	Max	Unit
Input Capacitance	C _{IN}	V _{IN} =0V	-	5	pF

Chip Select Hold from Clock High	t _{CSH}	0.5	-	0.5	-	ns
ZZ High to Power Down	t _{PDS}	2	-	2	-	cycle
ZZ Low to Power Up	t _{PUS}	2	-	2	-	cycle

- Notes :**
1. The above parameters are also guaranteed at industrial temperature range.
 2. All address inputs must meet the specified setup and hold times for all rising clock edges whenever \overline{ADSC} and/or \overline{ADSP} is sampled low and \overline{CS} is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 3. Both chip selects must be active whenever \overline{ADSC} or \overline{ADSP} is sampled low in order for the this device to remain enabled.
 4. \overline{ADSC} or \overline{ADSP} must not be asserted for at least 2 Clock after leaving ZZ state.

1Mx36 & 2Mx18 Flow-Trough SRAM

Sleep Mode

Sleep Mode is a low current, power-down mode in which the device is deselected and current is reduced to I_{SB2} . The duration of Sleep Mode is dictated by the length of time the ZZ is in a High state.

After entering Sleep Mode, all inputs except ZZ become disabled and all outputs go to High-Z.

The ZZ pin is an asynchronous, active high input that causes the device to enter Sleep Mode.

When the ZZ pin becomes a logic High, I_{SB2} is guaranteed after the time t_{ZZI} is met. Any operation pending when entering Sleep Mode is not guaranteed to successful complete. Therefore, Sleep Mode (Read or Write) must not be initiated until valid pending operations are completed. Similarly, when exiting Sleep Mode during t_{PUS} , only a Deselect or Read cycle should be given while the SRAM is transitioning out of Sleep Mode.

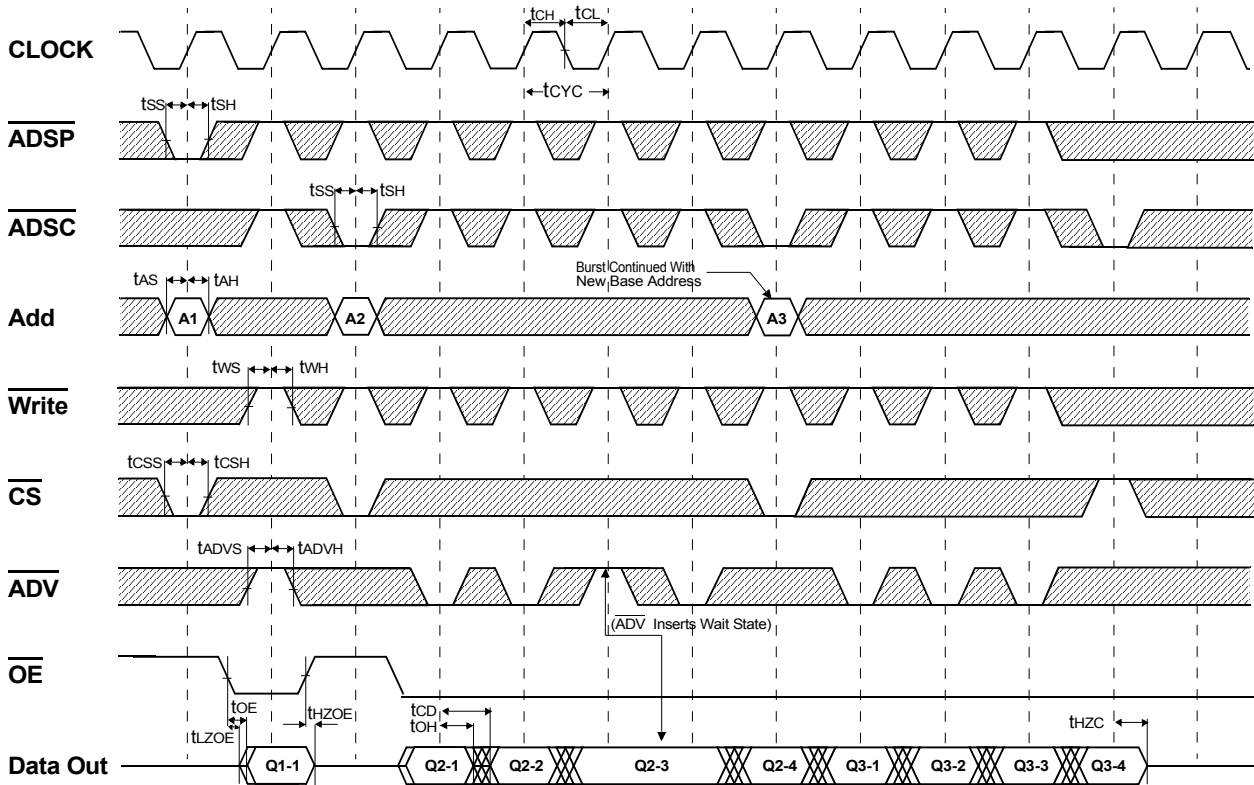

Sleep Mode Electrical Characteristics

Description	Condition	Symbol	Min	Max	Unit
Current during SLEEP MODE	$ZZ \geq V_{IH}$	I_{SB2}		120	mA
ZZ active to input ignored		t_{PDS}	2		cycle
ZZ inactive to input sampled		t_{PUS}	2		cycle
ZZ active to SLEEP current		t_{ZZI}		2	cycle
ZZ inactive to exit SLEEP current		t_{RZZI}	0

IEEE 1149.1 Test Access Port and Boundary Scan-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port (TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to V_{SS} to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to V_{DD} through a resistor. TDO should be left unconnected.

JTAG Block Diagram

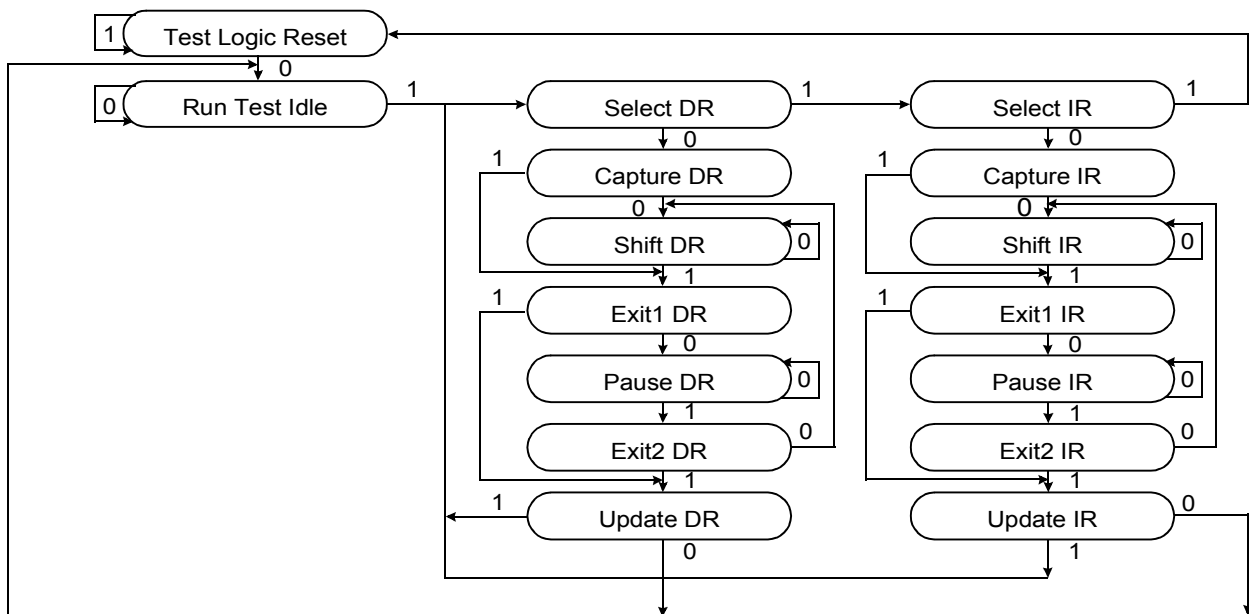

JTAG Instruction Coding

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	BYPASS	Bypass Register	4
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	BYPASS	Bypass Register	4
1	1	1	BYPASS	Bypass Register	4

NOTE:

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to V_{SS} when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.
