## Document Title

**1Mx36 & 2Mx18 & 4Mx9 - Bit Quadruple-II Burst Length of 4 SRAM**

## Revision History

Rev. No.	History	Draft Date	Remark
0.0	Initial Draft	Mar. 2012	Preliminary
1.0	Final spec release Add DC current spec value	Feb. 2013	Final
1.1	Change Thermal Resistance $\theta_{JA}$ value from 20.8°C/W to 16.3°C/W	Apr. 2013	Final
1.2	Change DLL locking time spec to 1024cycles from 2048cycles	May 2013	Final

**1Mx36 & 2Mx18 & 4Mx9 Quadruple-II BL4 SRAM**

**1Mx36 & 2Mx18 & 4Mx9 - Bit Quadruple-II Burst Length of 4 SRAM**

**Features**

- 1.8V+0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future frequency scaling.
- I/O Supply Voltage 1.5V+0.1V/-0.1V for 1.5V I/O, 1.8V+0.1V/-0.1V for 1.8V I/O.
- Separate independent read and write data ports with concurrent read and write operation
- HSTL I/O
- Full data coherency, providing most current data.
- Synchronous pipeline read with self timed late write.
- Registered address, control and data input/output.
- DDR (Double Data Rate) Interface on read and write ports.
- Fixed 4-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks (K and  $\bar{K}$ ) for accurate DDR timing at clock rising edges only.
- Two input clocks for output data (C and  $\bar{C}$ ) to minimize clock-skew and flight-time mismatches.
- Two echo clocks (CQ and  $\bar{CQ}$ ) to enhance output data traceability.
- Single address bus.
- Byte write (x9, x18, x36) function.
- Separate read/write control pin ( $\bar{R}$  and  $\bar{W}$ )
- Simple depth expansion with no data contention.
- Programmable output impedance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array FBGA) with body size of 13x15mm & Lead Free

**Key Parameters**

Part Number	Org.	Cycle Time	Access Time	Unit	RoHS
S7R323684M-E(F)C(I)33	X36	3.0	0.45	ns	O
S7R323684M-E(F)C(I)30		3.3	0.45	ns	O
S7R323684M-E(F)C(I)25		4.0	0.45	ns	O
S7R321884M-E(F)C(I)33	X18	3.0	0.45	ns	O
S7R321884M-E(F)C(I)30		3.3	0.45	ns	O
S7R321884M-E(F)C(I)25		4.0	0.45	ns	O
S7R320984M-E(F)C(I)33	X9	3.0	0.45	ns	O
S7R320984M-E(F)C(I)30		3.3	0.45	ns	O
S7R320984M-E(F)C(I)25		4.0	0.45	ns	O

\* -E(F)C(I)  
 E(F) [Package type]: E-Pb Free, F-Pb  
 C(I) [Operating Temperature]: C-Commercial, I-Industrial

**GENERAL DESCRIPTION**

The S7R323684M, S7R321884M and S7R320984M are 37,748,736-bits Quadruple Synchronous Pipelined Burst SRAMs. They are organized as 1,048,576 words by 36bits for S7R323684M, 2,097,152 words by 18bits for S7R321884M and 4,194,304 words by 9bits for S7R320984M.

The Quadruple operation is possible by supporting DDR read and write operations through separate data output and input ports with the same cycle. Memory bandwidth is maximized as data can be transferred into SRAM on every rising edge of K and  $\bar{K}$ , and transferred out of SRAM on every rising edge of C and  $\bar{C}$ . And totally independent read and write ports eliminate the need for high speed bus turn around.

Address, data inputs, and all control signals are synchronized to the input clock (K or  $\bar{K}$ ). Normally data outputs are synchronized to output clocks (C and  $\bar{C}$ ), but when C and  $\bar{C}$  are tied high, the data outputs are synchronized to the input clocks (K and  $\bar{K}$ ). Read data are referenced to echo clock (CQ or  $\bar{CQ}$ ) outputs.

Common address bus is used to access address both for read and write operations. The internal burst counter is fixed to 4-bit sequential for both read and write operations. Synchronous pipeline read and late write enable high speed operations. Simple depth expansion is accomplished by using  $\bar{R}$  and  $\bar{W}$  for port selection. Byte write operation is supported with  $BW_0$  and  $BW_1$  ( $BW_2$  and  $BW_3$ ) pins for x18 (x36) device and only  $BW$  pin for x9 device.

IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.

The S7R323684M, S7R321884M and S7R320984M are implemented with Netsol's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

**Notes:** 1. C,  $\overline{C}$ , K or  $\overline{K}$  cannot be set to VREF voltage.  
2. When ZQ pin is directly connected to VDD output impedance is set to minimum value and it cannot be connected to ground or left unconnected.  
3. Not connected to chip pad internally.

## Read Operations

Read cycles are initiated by activating  $\overline{R}$  at the rising edge of the positive input clock K. Address is presented and stored in the read address register synchronized with K clock. For 4-bit burst DDR operation, it will access four 36-bit, 18-bit or 9-bit data words with each read command. The first pipelined data is transferred out of the device triggered by  $\overline{C}$  clock following next  $\overline{K}$  clock rising edge. Next burst data is triggered by the rising edge of following C clock rising edge. The process continues until all four data are transferred. Continuous read operations are initiated with K clock rising edge. And pipelined data are transferred out of device on every rising edge of both C and  $\overline{C}$  clocks. In case C and  $\overline{C}$  tied to high, output data are triggered by K and  $\overline{K}$  instead of C and  $\overline{C}$ . When the  $\overline{R}$  is disabled after a read operation, the S7R323684M, S7R321884M and S7R320984M will first complete burst read operation before entering into deselect mode at the next K clock rising edge. Then output drivers disabled automatically to high impedance state.

## Write Operations

Write cycles are initiated by activating  $\overline{W}$  at the rising edge of the positive input clock K. Address is presented and stored in the write address register synchronized with K clock. For 4-bit burst DDR operation, it will write four 36-bit, 18-bit or 9-bit data words with each write command. The first "late" data is transferred and registered in to the device synchronous with next K clock rising edge. Next burst data is transferred and registered synchronous with following  $\overline{K}$  clock rising edge. The process continues until all four data are transferred and registered. Continuous write operations are initiated with K rising edge. And "late write" data is presented to the device on every rising edge of both K and  $\overline{K}$  clocks. The device disregards input data presented on the same cycle  $\overline{W}$  disabled. When the  $\overline{W}$  is disabled after a write operation, the S7R323684M, S7R321884M and S7R320984M will first complete burst write operation before entering into deselect mode at the next K clock rising edge. The S7R323684M, S7R321884M and S7R320984M support byte write operations. With activating  $\overline{BW}_0$  or  $\overline{BW}_1$  ( $\overline{BW}_2$  or  $\overline{BW}_3$ ) in write cycle, only one byte of input data is presented. In S7R321884M,  $\overline{BW}_0$  controls write operation to D0:D8,  $\overline{BW}_1$  controls write operation to D9:D17. And in S7R323684M  $\overline{BW}_2$  controls write operation to D18:D26,  $\overline{BW}_3$  controls write operation to D27:D35. And in S7R320984M  $\overline{BW}$  controls write operation to D0:D8.

## Single Clock Mode

S7R323684M, S7R321884M and S7R320984M can be operated with the single clock pair K and  $\overline{K}$ , instead of C or  $\overline{C}$  for output clocks. To operate these devices in single clock mode, C and  $\overline{C}$  must be tied high during power up and must be maintained high during operation. After power up, this device can't change to or from single clock mode. System flight time and clock skew could not be compensated in this mode.

## Depth Expansion

Separate input and output ports enables easy depth expansion. Each port can be selected and deselected independently and read and write operation do not affect each other. Before chip deselected, all read and write pending operations are completed.

## Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to Vss through a precision resistor (RQ). The value of RQ (within 15%) is five times the output impedance desired. For example, 250Ω resistor will give an output impedance of 50Ω. Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles. In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM. To guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

## Echo clock operation

To assure the output traceability, the SRAM provides the output Echo clock, pair of compliment clock CQ and  $\overline{CQ}$ , which are synchronized with internal data output. Echo clocks run free during normal operation. The Echo clock is triggered by internal output clock signal, and transferred to external through same structures as output driver.

### **Clock Consideration**

S7R323684M, S7R321884M and S7R320984M utilizes internal DLL (Delay-Locked Loops) for maximum output data valid window. It can be placed into a stopped-clock state to minimize power with a modest restart time of 1024 clock cycles. Circuitry automatically resets the DLL when absence of input clock is detected.

### **Power-Up/Power-Down Supply Voltage Sequencing**

The following power-up supply voltage application is recommended: V<sub>SS</sub>, V<sub>DD</sub>, V<sub>DDQ</sub>, V<sub>REF</sub>, then V<sub>IN</sub>. V<sub>DD</sub> and V<sub>DDQ</sub> can be applied simultaneously, as long as V<sub>DDQ</sub> does not exceed V<sub>DD</sub> by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: V<sub>IN</sub>, V<sub>REF</sub>, V<sub>DDQ</sub>, V<sub>DD</sub>, V<sub>SS</sub>. V<sub>DD</sub> and V<sub>DDQ</sub> can be removed simultaneously, as long as V<sub>DDQ</sub> does not exceed V<sub>DD</sub> by more than 0.5V during power-down.

### **Detail Specification of Power-Up Sequence in Quadruple-II SRAM**

Quadruple-II SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

#### **• Power-Up Sequence**

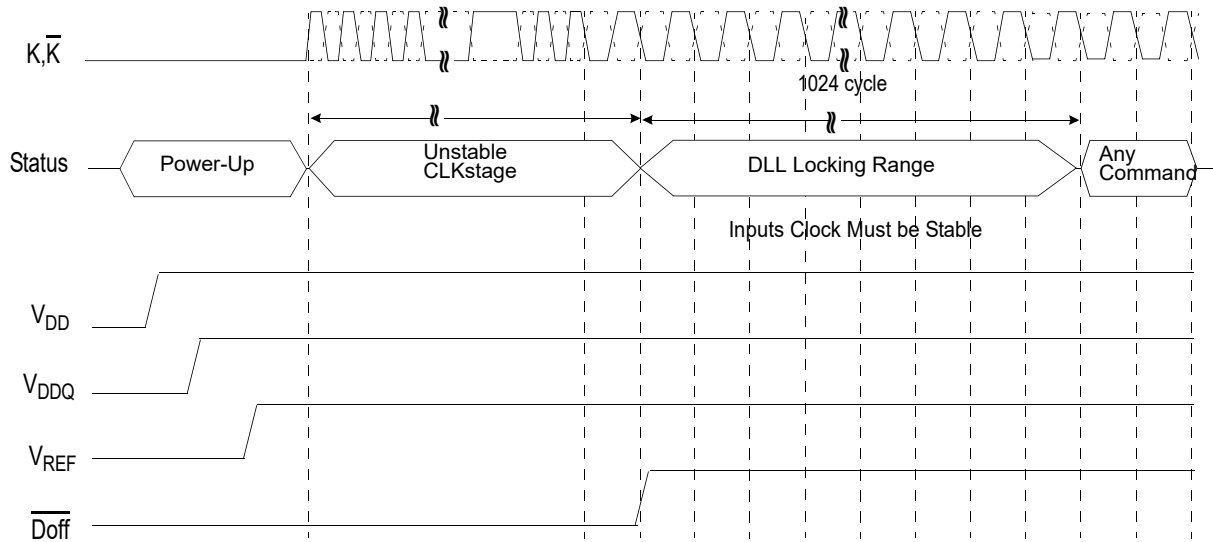

1. Apply power and keep  $\overline{\text{Doff}}$  at low state (All other inputs may be undefined)
  - Apply V<sub>DD</sub> before V<sub>DDQ</sub>
  - Apply V<sub>DDQ</sub> before V<sub>REF</sub> or the same time with V<sub>REF</sub>
2. Just after the stable power and clock (K,  $\overline{\text{K}}$ , C,  $\overline{\text{C}}$ ), take  $\overline{\text{Doff}}$  to be high.
3. The additional 1024 cycles of clock input is required to lock the DLL after enabling DLL

\* **Notes:** If you want to tie up the  $\overline{\text{Doff}}$  pin to High with unstable clock, then you must stop the clock for a few seconds (Min. 30ns) to reset the DLL after it become a stable clock status.

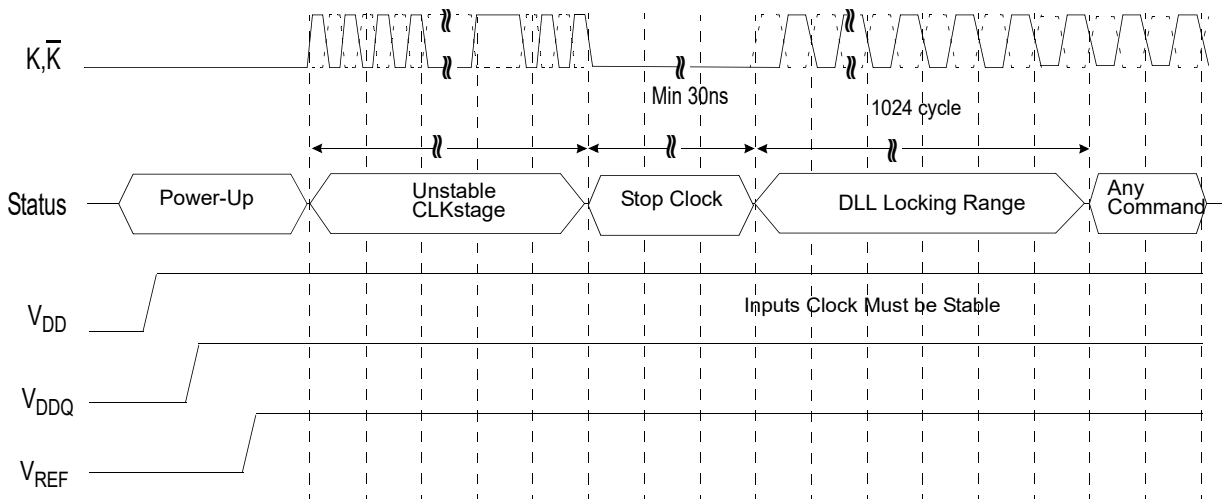

#### **• DLL Constraints**

1. DLL uses either K or C clock as its synchronizing input, the input should have low phase jitter which is specified as TKC var.
2. The lower end of the frequency at which the DLL can operate is 8.4ns.
3. If the incoming clock is unstable and the DLL is enabled, then the DLL may lock onto a wrong frequency and this may cause the failure in the initial stage.

**Power up & Initialization Sequence (Doff pin controlled)**

**Power up & Initialization Sequence (Doff pin Fixed high, Clock controlled)**

\* **Notes:** When the operating frequency is changed, It is required to reset DLL again.  
 After resetting DLL, the minimum 1024 cycles of clock input is needed to lock the DLL.

**Truth Tables**

**SYNCHRONOUS TRUTH TABLE**

K	$\bar{R}$	$\bar{W}$	D				Q				OPERATION
			D(A1)	D(A2)	D(A3)	D(A4)	Q(A1)	Q(A2)	Q(A3)	Q(A4)	
Stopped	X	X	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Clock Stop
↑	H	H	X	X	X	X	High-Z	High-Z	High-Z	High-Z	No Operation
↑	L <sup>4</sup>	X	X	X	X	X	D <sub>OUT</sub> at C(t+1)	D <sub>OUT</sub> at C(t+2)	D <sub>OUT</sub> at C(t+2)	D <sub>OUT</sub> at C(t+3)	Read
↑	H <sup>5</sup>	L <sup>4</sup>	D <sub>in</sub> at K(t+1)	D <sub>in</sub> at K(t+1)	D <sub>in</sub> at K(t+2)	D <sub>in</sub> at K(t+2)	X	X	X	X	Write

- Notes:**
1. X means "Don't Care".
  2. The rising edge of clock is symbolized by ( ↑ ).
  3. Before enter into clock stop status, all pending read and write operations will be completed.
  4. This signal was HIGH on previous K clock rising edge. Initiating consecutive READ or WRITE operations on consecutive K clock rising edges is not permitted. The device will ignore the second request.
  5. If this signal was LOW to initiated the previous cycle, this signal becomes a don't care for this operation however it is strongly recommended that this signal is brought HIGH as shown in the truth table.

**WRITE TRUTH TABLE (x18)**

K	$\bar{K}$	$\bar{BW}_0$	$\bar{BW}_1$	Operation
↑		L	L	WRITE ALL BYTES ( K↑ )
	↑	L	L	WRITE ALL BYTES ( $\bar{K}$ ↑ )
↑		L	H	WRITE BYTE 0 ( K↑ )
	↑	L	H	WRITE BYTE 0 ( $\bar{K}$ ↑ )
↑		H	L	WRITE BYTE 1 ( K↑ )
	↑	H	L	WRITE BYTE 1 ( $\bar{K}$ ↑ )
↑		H	H	WRITE NOTHING ( K↑ )
	↑	H	H	WRITE NOTHING ( $\bar{K}$ ↑ )

- Notes:**
1. X means "Don't Care".
  2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or  $\bar{K}$  ( ↑ ).
  3. Assumes a WRITE cycle was initiated.
  4. This table illustrates operation for x18 devices. x9 device operation is similar except that  $\bar{BW}$  controls D0:D8.

**WRITE TRUTH TABLE (x36)**

K	$\bar{K}$	$\bar{BW}_0$	$\bar{BW}_1$	$\bar{BW}_2$	$\bar{BW}_3$	Operation
↑		L	L	L	L	WRITE ALL BYTES ( K↑ )
	↑	L	L	L	L	WRITE ALL BYTES ( $\bar{K}$ ↑ )
↑		L	H	H	H	WRITE BYTE 0 ( K↑ )
	↑	L	H	H	H	WRITE BYTE 0 ( $\bar{K}$ ↑ )
↑		H	L	H	H	WRITE BYTE 1 ( K↑ )
	↑	H	L	H	H	WRITE BYTE 1 ( $\bar{K}$ ↑ )
↑		H	H	L	L	WRITE BYTE 2 and BYTE 3 ( K↑ )
	↑	H	H	L	L	WRITE BYTE 2 and BYTE 3 ( $\bar{K}$ ↑ )
↑		H	H	H	H	WRITE NOTHING ( K↑ )
	↑	H	H	H	H	WRITE NOTHING ( $\bar{K}$ ↑ )

- Notes:**
1. X means "Don't Care".
  2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or  $\bar{K}$  ( ↑ ).
  3. Assumes a WRITE cycle was initiated.

**Absolute Maximum Ratings\***

Parameter	Symbol	Rating	Unit
Voltage on V <sub>DD</sub> Supply Relative to V <sub>SS</sub>	V <sub>DD</sub>	-0.5 to 2.9	V
Voltage on V <sub>DDQ</sub> Supply Relative to V <sub>SS</sub>	V <sub>DDQ</sub>	-0.5 to V <sub>DD</sub>	V
Voltage on Input Pin Relative to V <sub>SS</sub>	V <sub>IN</sub>	-0.5 to V <sub>DD</sub> +0.3	V
Storage Temperature	T <sub>STG</sub>	-65 to 150	°C
Operating Temperature	T <sub>OPR</sub>	0 to 70 / -40 to 85	°C
Storage Temperature Range Under Bias	T <sub>BIAS</sub>	-10 to 85	°C

- \*Note: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.  
2. V<sub>DDQ</sub> must not exceed V<sub>DD</sub> during normal operation.

**Operating Conditions**

Parameter	Symbol	Min	Max	Unit
Supply Voltage	V <sub>DD</sub>	1.7	1.9	V
	V <sub>DDQ</sub>	1.4	1.9	V
Reference Voltage	V <sub>REF</sub>	0.68	0.95	V

**DC Electrical Characteristics**

Parameter	Symbol	test Conditions	Min	Max	Unit	Notes
Input Leakage Current	I <sub>IL</sub>	V <sub>DD</sub> =Max; V <sub>IN</sub> =V <sub>SS</sub> to V <sub>DDQ</sub>	-2	+2	μA	
Output Leakage Current	I <sub>OL</sub>	Output Disabled,	-2	+2	μA	
Operating Current (x36)	I <sub>CC</sub>	V <sub>DD</sub> =Max, I <sub>OUT</sub> =0mA Cycle Time ≥ t <sub>KHKH</sub> Min	-33	600	mA	1,5
			-30	565		
			-25	500		
Operating Current (x18)	I <sub>CC</sub>	V <sub>DD</sub> =Max, I <sub>OUT</sub> =0mA Cycle Time ≥ t <sub>KHKH</sub> Min	-33	500	mA	1,5
			-30	475		
			-25	430		
Operating Current (x9)	I <sub>CC</sub>	V <sub>DD</sub> =Max, I <sub>OUT</sub> =0mA Cycle Time ≥ t <sub>KHKH</sub> Min	-33	490	mA	1,5
			-30	465		
			-25	420		
Standby Current (NOP)	I <sub>SB1</sub>	Device deselected, I <sub>OUT</sub> =0mA, f=Max, All Inputs ≤ 0.2V or ≥ V <sub>DD</sub> -0.2V	-33	250	mA	1,6
			-30	245		
			-25	235		
Output High Voltage	V <sub>OH1</sub>		V <sub>DDQ</sub> /2-0.12	V <sub>DDQ</sub> /2+0.12	V	2,7
Output Low Voltage	V <sub>OL1</sub>		V <sub>DDQ</sub> /2-0.12	V <sub>DDQ</sub> /2+0.12	V	3,7
Output High Voltage	V <sub>OH2</sub>	I <sub>OH</sub> =-1.0mA	V <sub>DDQ</sub> -0.2	V <sub>DDQ</sub>	V	4
Output Low Voltage	V <sub>OL2</sub>	I <sub>OL</sub> =1.0mA	V <sub>SS</sub>	0.2	V	4
Input Low Voltage	V <sub>IL</sub>		-0.3	V <sub>REF</sub> -0.1	V	8,9
Input High Voltage	V <sub>IH</sub>		V <sub>REF</sub> +0.1	V <sub>DDQ</sub> +0.3	V	8,10

- Notes: 1. Minimum cycle. I<sub>OUT</sub>=0mA.  
2. |I<sub>OH</sub>|=(V<sub>DDQ</sub>/2)/(R<sub>Q</sub>/5) for 175Ω ≤ R<sub>Q</sub> ≤ 350Ω.  
3. |I<sub>OL</sub>|=(V<sub>DDQ</sub>/2)/(R<sub>Q</sub>/5) for 175Ω ≤ R<sub>Q</sub> ≤ 350Ω.  
4. Minimum Impedance Mode when ZQ pin is connected to V<sub>DD</sub>.  
5. Operating current is calculated with 50% read cycles and 50% write cycles.  
6. Standby Current is only after all pending read and write burst operations are completed.  
7. Programmable Impedance Mode.  
8. These are DC test criteria. DC design criteria is V<sub>REF</sub>±50mV. The AC V<sub>IH</sub>/V<sub>IL</sub> levels are defined separately for measuring timing parameters.  
9. V<sub>IL</sub> (Min.) DC=-0.3V, V<sub>IL</sub> (Min.) AC=-1.5V(pulse width ≤ 3ns).  
10. V<sub>IH</sub> (Max) DC=V<sub>DDQ</sub>+0.3, V<sub>IH</sub> (Max) AC=V<sub>DDQ</sub>+0.85V(pulse width ≤ 3ns).

C, $\bar{C}$ High to Echo Clock Hold	t <sub>CHCQX</sub>	-0.45		-0.45		-0.45		ns	
CQ, $\bar{CQ}$ High to Output Valid	t <sub>CQHCV</sub>		0.25		0.27		0.30	ns	7
CQ, $\bar{CQ}$ High to Output Hold	t <sub>CQHCVX</sub>	-0.25		-0.27		-0.30		ns	7
$\bar{C}$ , High to Output High-Z	t <sub>CHQZ</sub>		0.45		0.45		0.45	ns	3
$\bar{C}$ , High to Output Low-Z	t <sub>CHQX1</sub>	-0.45		-0.45		-0.45		ns	3
<b>Setup Times</b>									
Address valid to K rising edge	t <sub>AVKH</sub>	0.40		0.40		0.50		ns	
Control inputs valid to K rising edge	t <sub>IVKH</sub>	0.40		0.40		0.50		ns	2
Data-in valid to K, $\bar{K}$ rising edge	t <sub>DVKH</sub>	0.28		0.30		0.35		ns	
<b>Hold Times</b>									
K rising edge to address hold	t <sub>KHAX</sub>	0.40		0.40		0.50		ns	
K rising edge to control inputs hold	t <sub>KHIX</sub>	0.40		0.40		0.50		ns	
K, $\bar{K}$ rising edge to data-in hold	t <sub>KHDX</sub>	0.28		0.30		0.35		ns	

- Notes:** 1. All address inputs must meet the specified setup and hold times for all latching clock edges.  
2. Control singles are  $\bar{R}$ ,  $\bar{W}$ ,  $\bar{BW}_0$ ,  $\bar{BW}_1$  and  $\bar{BW}_2$ ,  $\bar{BW}_3$ , also for x36  
3. If C,  $\bar{C}$  are tied high, K,  $\bar{K}$  become the references for C,  $\bar{C}$  timing parameters.  
4. To avoid bus contention, at a given voltage and temperature t<sub>CHQX1</sub> is bigger than t<sub>CHQZ</sub>.  
The specs as shown do not imply bus contention because t<sub>CHQX1</sub> is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than t<sub>CHQZ</sub>, which is a MAX parameter (worst case at 70°C, 1.7V)  
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.  
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.  
6. V<sub>dd</sub> slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once V<sub>dd</sub> and input clock are stable.  
7. Echo clock is very tightly controlled to data valid/data hold. By design, there is a ± 0.1 ns variation from echo clock to data.  
The data sheet parameters reflect tester guardbands and test setup variations.

**IEEE 1149.1 Test Access Port and Boundary Scan-JTAG**

This part contains an IEEE standard 1149.1 Compatible Test Access Port (TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to Vss to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to VDD through a resistor. TDO should be left unconnected.

**JTAG Block Diagram**

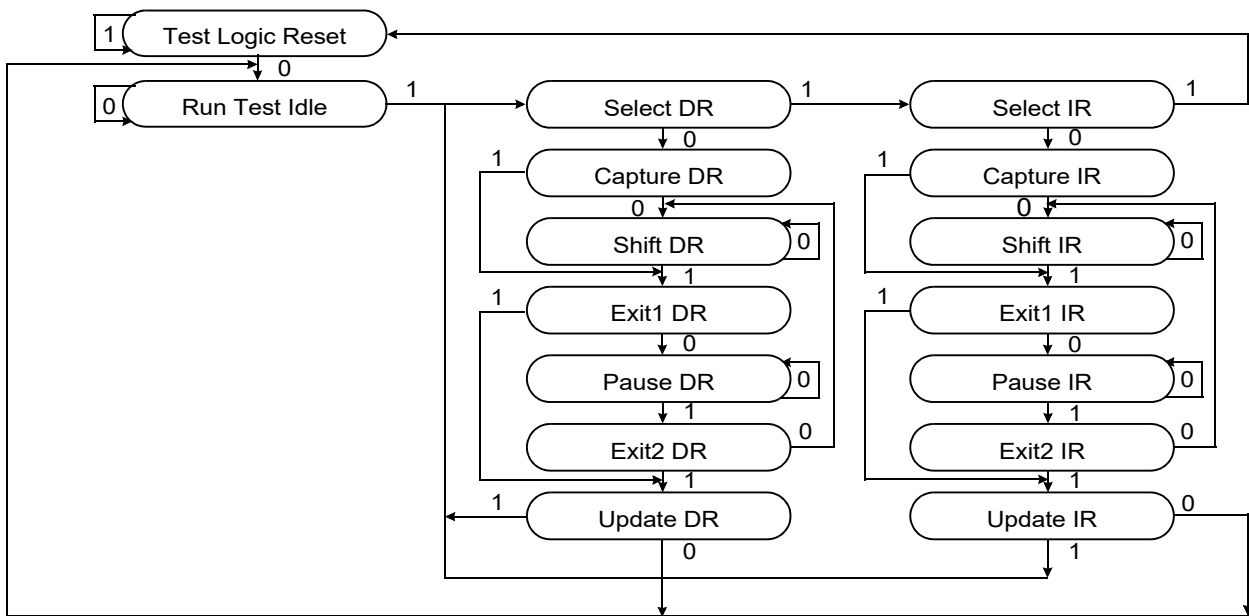

**JTAG Instruction Coding**

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	RESERVED	Do Not Use	6
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	RESERVED	Do Not Use	6
1	1	1	BYPASS	Bypass Register	4

**NOTE:**

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to Vss when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.

**S7R320984M**

**1Mx36 & 2Mx18 & 4Mx9 Quadruple-II BL4 SRAM**

**JTAG DC Operating Conditions**

Parameter	Symbol	Min	Typ	Max	Unit	Note
Power Supply Voltage	V <sub>DD</sub>	1.7	1.8	1.9	V	
Input High Level	V <sub>IH</sub>	1.3	-	V <sub>DD</sub> +0.3	V	
Input Low Level	V <sub>IL</sub>	-0.3	-	0.5	V	
Output High Voltage (I <sub>OH</sub> =-2mA)	V <sub>OH</sub>	1.4	-	V <sub>DD</sub>	V	
Output Low Voltage(I <sub>OL</sub> =2mA)	V <sub>OL</sub>	V <sub>SS</sub>	-	0.4	V	

**Note:** 1. The input level of SRAM pin is to follow the SRAM DC specification.

**JTAG AC Test Conditions**

Parameter	Symbol	Min	Unit	Note
Input High/Low Level	V <sub>IH</sub> /V <sub>IL</sub>	1.8/0.0	V	
Input Rise/Fall Time	TR/TF	1.0/1.0	ns	
Input and Output Timing Reference Level		0.9	V	1

**Note:** 1. See SRAM AC test output load on page 11.

**JTAG AC Characteristics**

Parameter	Symbol	Min	Max	Unit	Note
TCK Cycle Time	t <sub>CHCH</sub>	50	-	ns	
TCK High Pulse Width	t <sub>CHCL</sub>	20	-	ns	
TCK Low Pulse Width	t <sub>CLCH</sub>	20	-	ns	
TMS Input Setup Time	t <sub>MVCH</sub>	5	-	ns	
TMS Input Hold Time	t <sub>CHMX</sub>	5	-	ns	
TDI Input Setup Time	t <sub>DVCH</sub>	5	-	ns	
TDI Input Hold Time	t <sub>CHDX</sub>	5	-	ns	
SRAM Input Setup Time	t <sub>SVCH</sub>	5	-	ns	
SRAM Input Hold Time	t <sub>CHSX</sub>	5	-	ns	
Clock Low to Output Valid	t <sub>CLQV</sub>	0	10	ns
